

ABSTRACT OF THE DISCLOSURE

A compact package for a garment made from a delicate material includes a container body having a volume of less than 10 in³ (164 cm³), a delicate material garment, a cover member and a cap. The cover member is inserted into the container body atop the garment, followed by the cap. Preferably, a buffer material is arranged between the garment and the cover member within the container body to protect the garment from damage during the packing process. The package is preferably produced by directing the garment and buffer material into a pre-loading tube, followed by shifting of a plunger member to load the container body with the garment, buffer material and the cover member. Subsequently, the cap is snap-fit upon the container body.
